CREW

Benzodiazepines are commonly prescribed to manage anxiety. When not used as prescribed they can have a negative effect on mental health. You can't be sure of the contents if the pills you are taking have not been prescribed.

Strength can vary even between pills from the same batch/packet if unlicensed, even if the pills look the same. It can take longer for the effects of some benzos to come on. Be aware that some pills sold as benzos may contain a mix of different benzodiazepines or other drugs. This can make it difficult to judge your dose and manage your tolerance.

Just say know. Test substances if you can. Take a small test dose, wait two hours before taking any more and avoid mixing with other drugs - including alcohol.
