

TEST YOUR DRUGS

using a drug testing kit

Test before you ingest

The product you buy might not always be the drug that you expect. Drugs in circulation may be more potent than expected meaning you need less of them to feel the effects. They might be a mix of unexpected contents and be more risky.

A drug testing kit is something anyone can use. It involves the use of chemical 'reagents' that change colour depending on which drug they are exposed to. They don't give as much information as lab analysis would. The effectiveness of using a test kit depends on you following the instructions properly and also reading the results properly.

Test kits are used to rule IN the presence of a drug but cannot accurately rule OUT the presence of all possible adulterants (unexpected or unwanted substances) and can tell you nothing about purity or dose.

The use of a test kit is a harm reduction strategy and doesn't remove the risk of taking drugs completely. Even pure drugs can be dangerous.
